Assignment: 1 & 2 JavaScript Form Validation

P100, P101, P103.P106 GROUPS

Assignments 1 and 2 must be attempted and submitted as individual tasks before the due date.

Objective:

Create a simple web form that validates user input using JavaScript. The form should collect the user's name, email address, and password. Implement validation rules to ensure that the form data is correct before submission.

Requirements:

1. **Form Structure:**
    - Create an HTML form with fields for:
        - **Name** (text input): Required, must be at least 3 characters long.
        - **Email** (email input): Required, must be a valid email address.
        - **Password** (password input): Required, must be at least 8 characters long and contain at least one uppercase letter, one lowercase letter, and one digit.
        - **Confirm Password** (password input): Required, must match the password field.
    - Include a submit button.
2. **Validation Rules:**
    - **Name Validation:**
        - Check if the name field is not empty.
        - Ensure the name is at least 3 characters long.
    - **Email Validation:**
        - Check if the email field is not empty.
        - Use a regular expression to validate the email format (e.g., example@example.com).
    - **Password Validation:**
        - Check if the password field is not empty.
        - Ensure the password is at least 8 characters long.

        - Verify that the password contains at least one uppercase letter, one lowercase letter, and one digit.
    - **Confirm Password Validation:**
        - Check if the confirm password field is not empty.
        - Ensure the confirm password matches the password.
3. **Error Handling:**
    - Display error messages next to each field if validation fails.
    - Use JavaScript to dynamically add or remove error messages based on user input.
4. **Submission:**
    - Prevent the form from submitting if any validation fails.
    - If all fields are valid, allow the form to submit and display a success message.

Implementation Steps:

1. Create the HTML structure for the form.
2. Write JavaScript code to validate each field based on the requirements.
3. Implement dynamic error message display.
4. Test the form to ensure all validation rules work correctly.

Bonus Points:

- Add a checkbox for terms and conditions. The form should not submit unless this checkbox is checked.
- Use CSS to style the form and make it visually appealing.

Submission Guidelines:

- Provide your HTML, CSS, and JavaScript code in separate files.
- Ensure that your code is well-organized and commented for clarity.
